Academic Projects:-

1."Natural Language Processing and e-Government: Extracting Reusable Crime Report Information"

Description:

We have developed the internet base crime reporting system that allows user to report crime occurs from anywhere. These existing E-mail and text-based systems provide little support for witness' memory recall leading to report's with less information and lower accuracy. These system also do not facilitate reuse and integration of the reported information with other information systems. We are developing an anonymous online crime reporting system that is designed to extract relevant crime information from witness's narratives and to ask additional questions based on that information. We leverage natural language processing and investigative interviewing techniques to support memory recall and map the information directly to a database to support information reuse. We report on the

evaluation of the suspect description module(SDM) of the system. Our interface captures 70%(recall) of information from witness narratives with 100% precision. Additional module will follow the design and development methods use with this module. All the crime report created by the witness which can be maintain in the database.

Environment:

JAVA, HTML, Java Script, CSS
